C++ Library Management System

By Yash Tambade

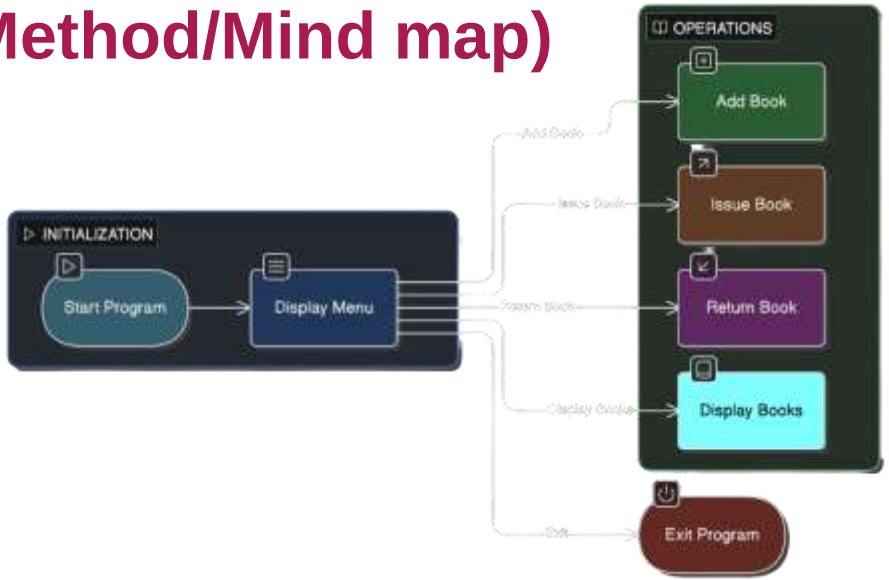
Problem Statement

- Libraries need a system to **manage books efficiently**.
  Manual management of books can cause problems such as:
- Difficulty tracking issued books
- Time-consuming record management
- Errors in maintaining book information
- Therefore, a **simple digital system** is required to manage library books using programming.

solution

- To solve this problem, we developed a **Library Management System using C++**.
- The program provides the following features:
- Add new books to the library
- Issue books to users
- Return issued books
- Display all available books
- The system uses **Object-Oriented Programming concepts** such as classes and functions to manage book records.

Working (Method/Mind map)



Key components used:

- **Class:** Book
- **Attributes:** ID, Title, Author, Issue Status
- **Functions:** addBook(), display()

Conclusion

- The Library Management System simplifies the process of managing books in a library.
- Benefits of the system:
- Easy to store book records
- Simple issuing and returning process
- Quick display of available books
- Future improvements can include:
- File storage or database integration
- User login system
- Graphical user interface (GUI)
